Overview

- Overview of Existing Projects
- Where to go for working examples/applications
- gr-mac – an open source MAC project
- (In-Tree OFDM Implementation)

In-Tree Modules and Examples

- Audio Examples → `gr-audio/examples`
 - Dual tone generation
 - Audio FFT, Resampling and More
 - Python/C++/GRC
- Lots of Examples → `gr-uhd/examples/`
 - USRP-specified examples
 - FM/AM/Weather receivers and PTT transmitters
 - Digital/PSK examples
 - `uhd_fft`
- Digital TV Reception → `gr-dtv/examples`
 - ATSC (US)
 - DVB-S/T/S2/etc coming soon!
- Digital Communications (mostly mPSK) → `gr-digital/examples/`
- Many other in-tree modules → `gr-fec`, `gr-fft`, `gr-filter`

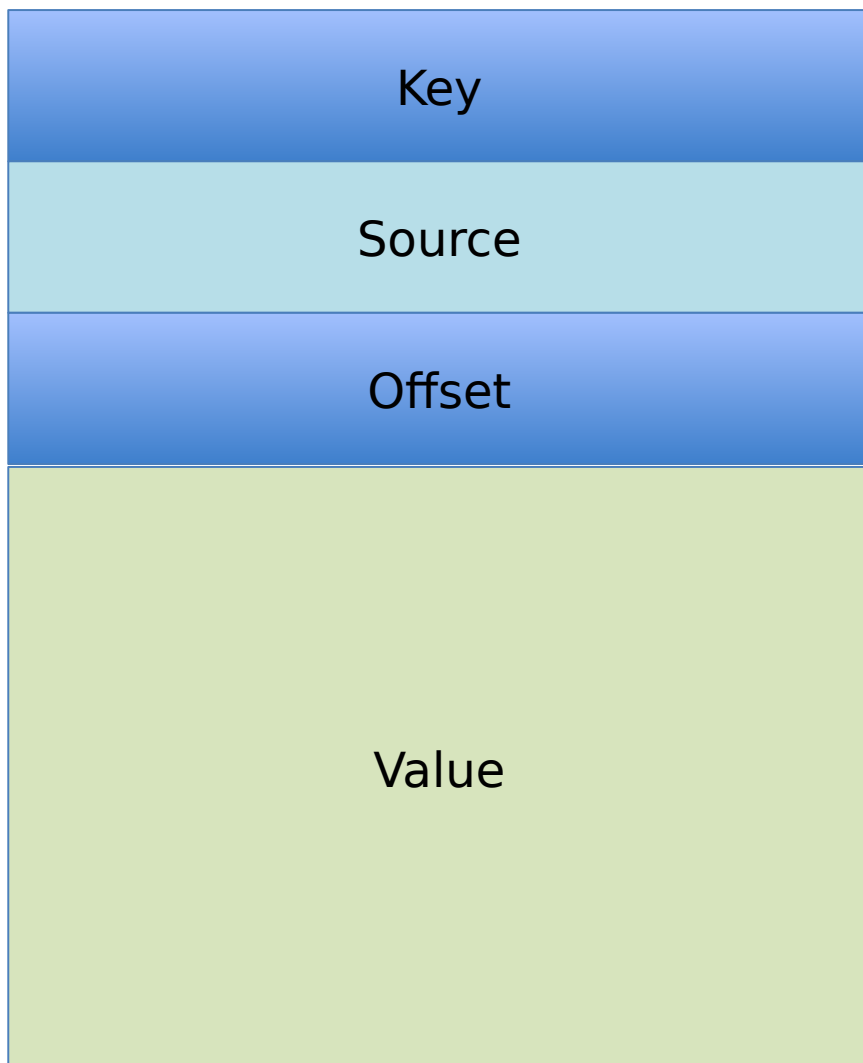

- gr-air-modes
- Receive aircraft RADAR beacons and plot in Google Earth!

A Few Important Concepts

- Shown several time throughout the week
- Important Features/Concepts
 - Samples vs. Polymorphic Types
 - Stream Tags
 - Message Passing API
 - PDUs
 - Advanced Hardware Support
 - C++ vs. Python Blocks

Polymorphic Data Types

Type: String
Used by blocks to identify PMT

Type: String
Specifies origin(block) of PMT

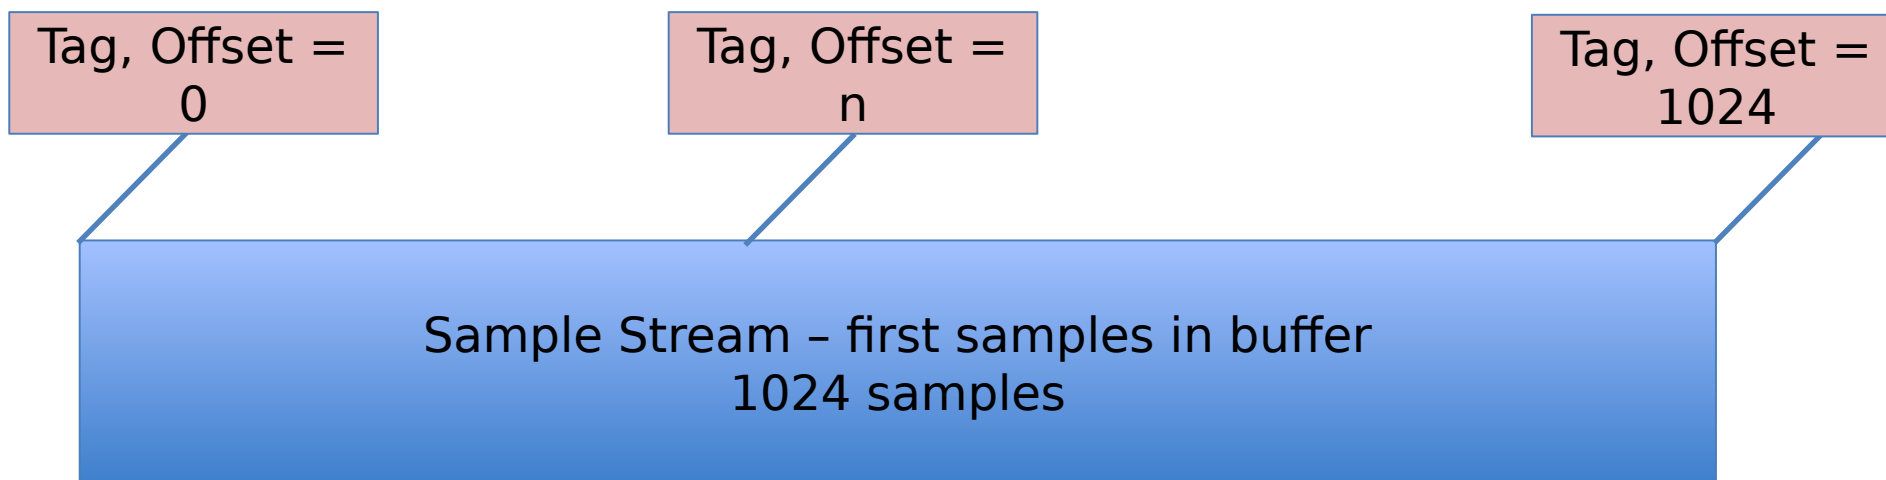

Type: Int
Specifies sample position

Type: Can be many types
"payload data"

Int, String, Bool, PDU, etc.

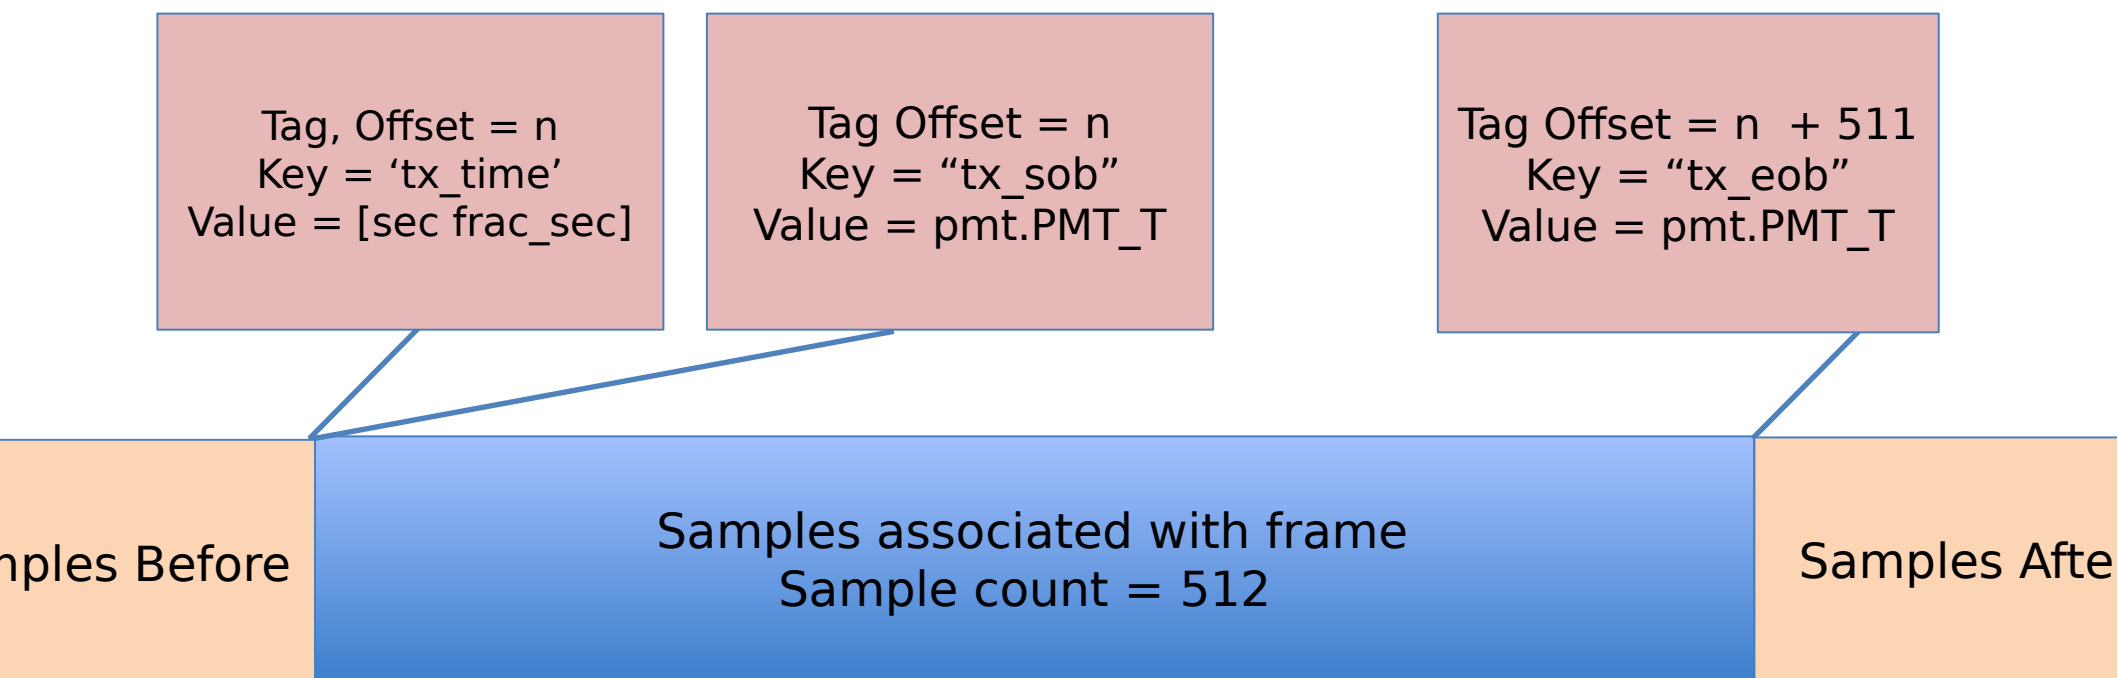

Stream Tags

- Tags - PMTs that are inserted into a GNU Radio sample stream
- PMT assigned absolute offset, tagging a specific sample
- Useful for synchronizing block functionality to DSP/samples
- Examples: UHD Sink understands tx_sob, tx_time, tx_eob tags

Half-Duplex/Bursting with Stream Tags

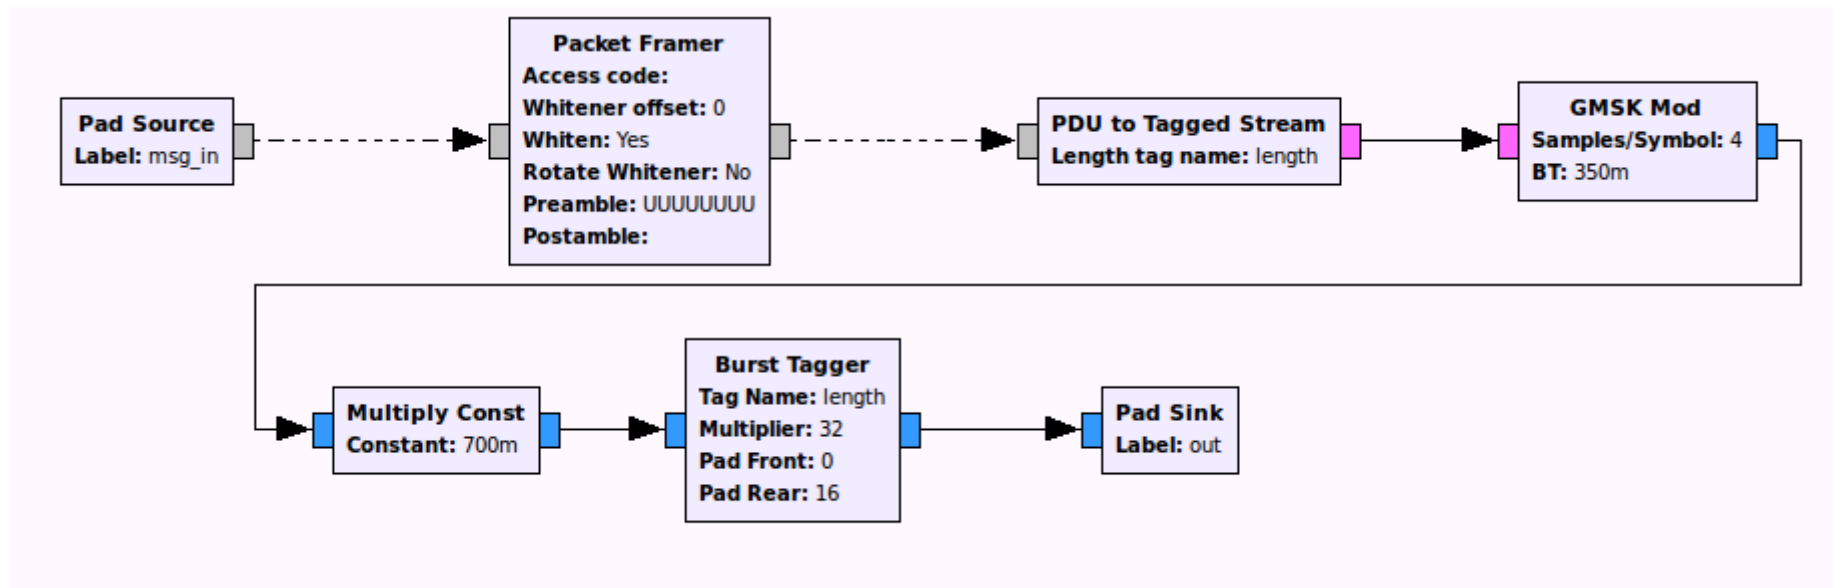

- Specifies time of burst, start of burst, and end-of-burst
- Useful for half-duplex systems that require tight control over tx/rx functionality

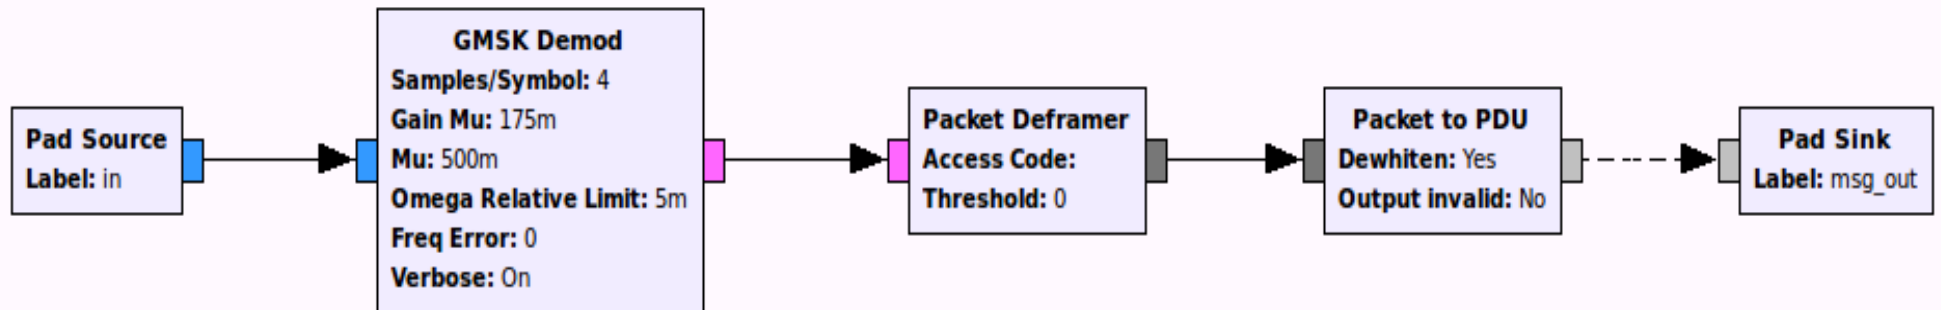

Tagged Stream Blocks

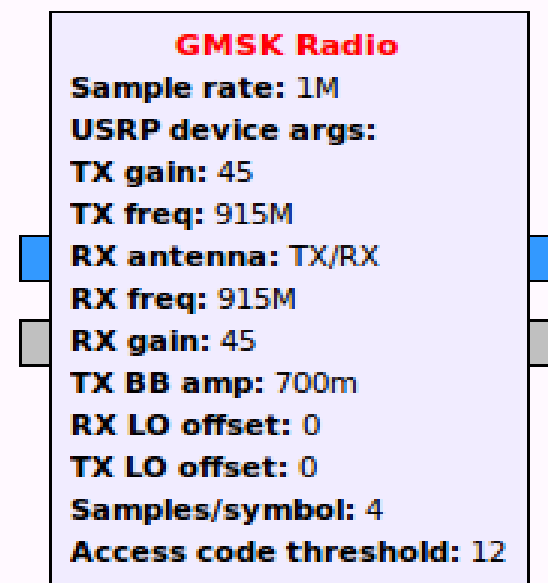

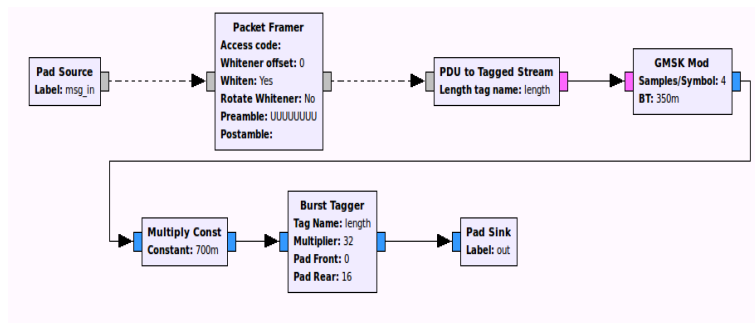

A Simple Transmitter

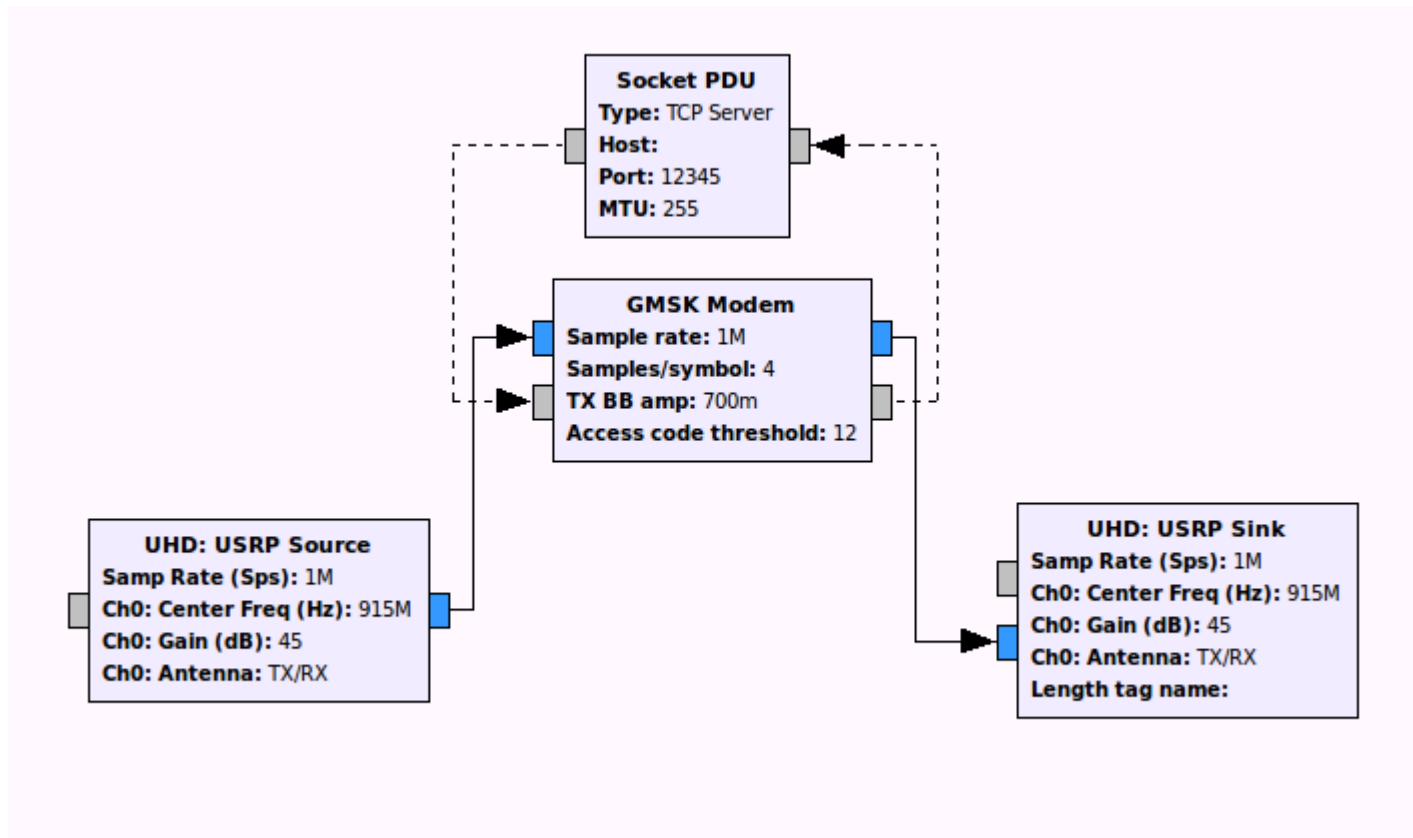

A Simple Receiver

A Hierarchal Block

A Simple Transceiver

Late-Night Demo Prep/Recording

MAC Frame

Sequence Number

Sequence Number for ARQ and dropped-frame detection

Destination Address

Address of radio we're sending this msg to.

Source Address

Radio's address ("my address")

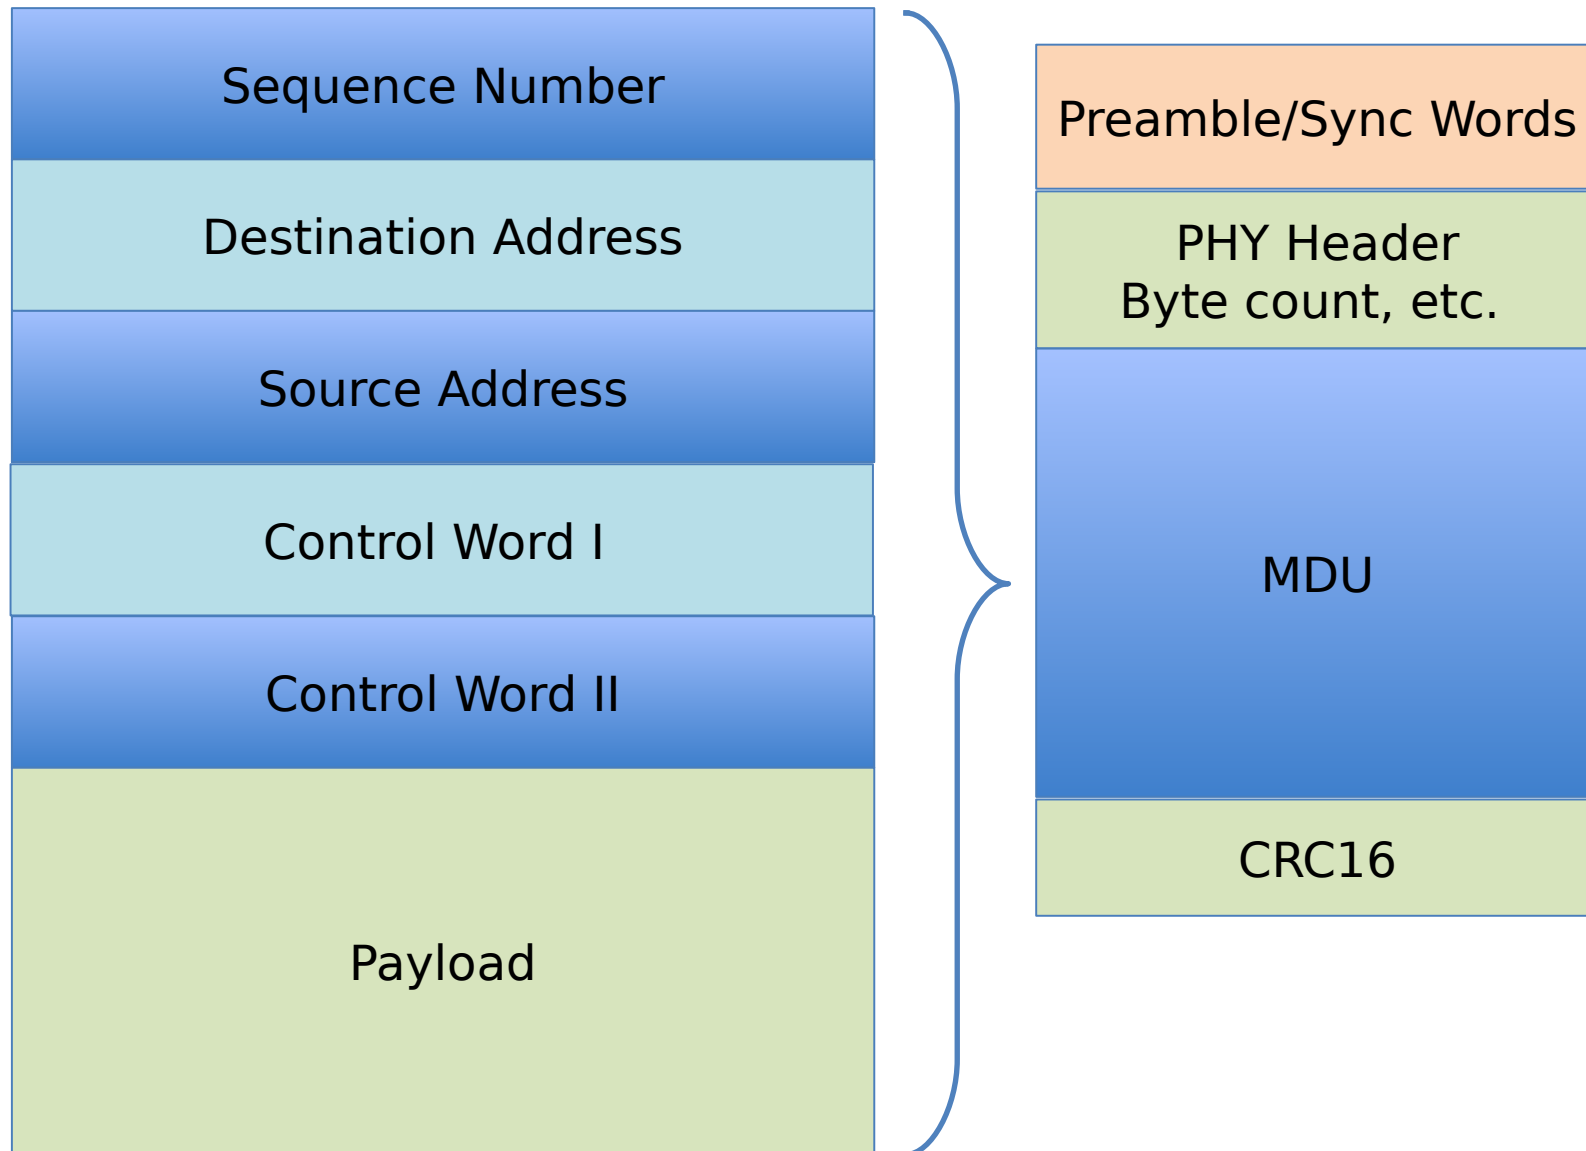

Control Word I

Control words: settings include ARQ, protocol id, FEC settings, etc.

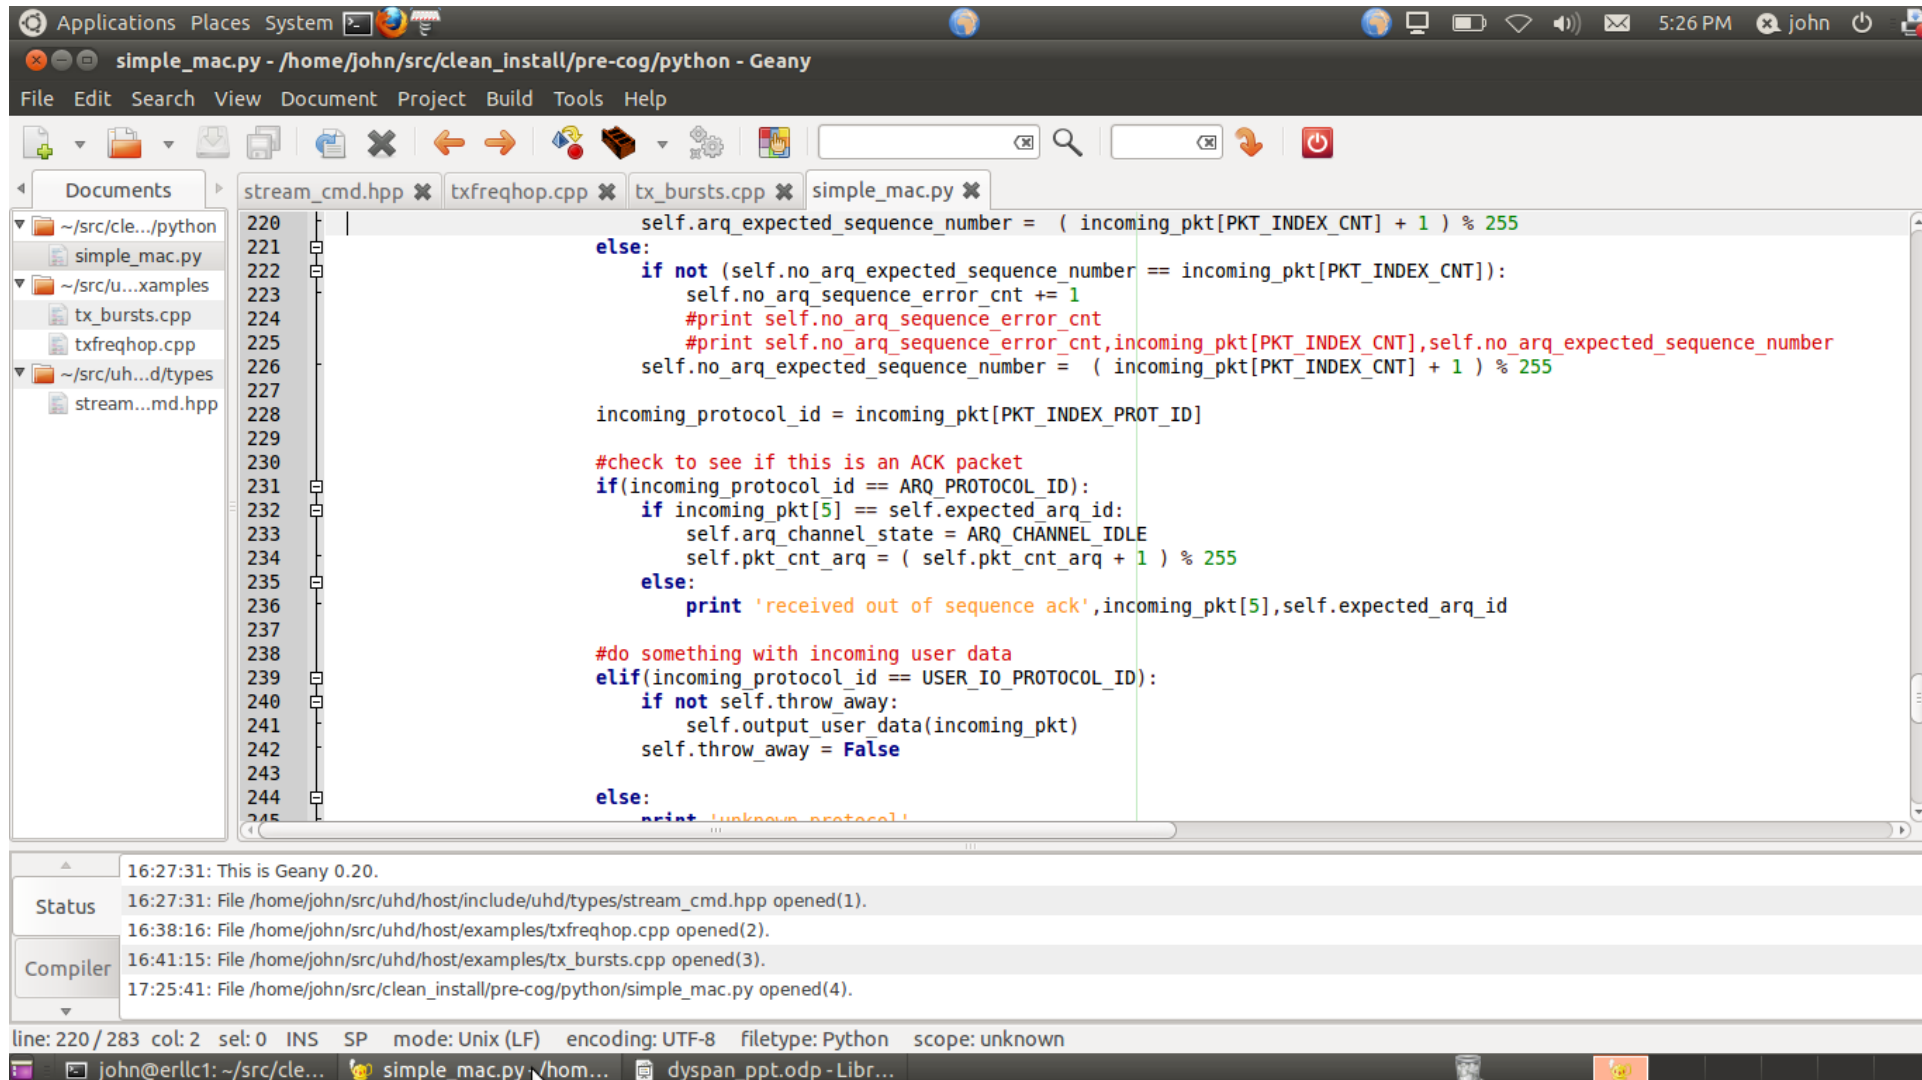

Control Word II

Payload

This is our payload, it can be represented as a "blob" and is in our implementation

A Simple Transceiver (simple_trx.py)

The screenshot shows the Geany IDE with the file `simple_mac.py` open. The code is a Python script for a simple transceiver. The terminal window at the bottom shows the following output:

```

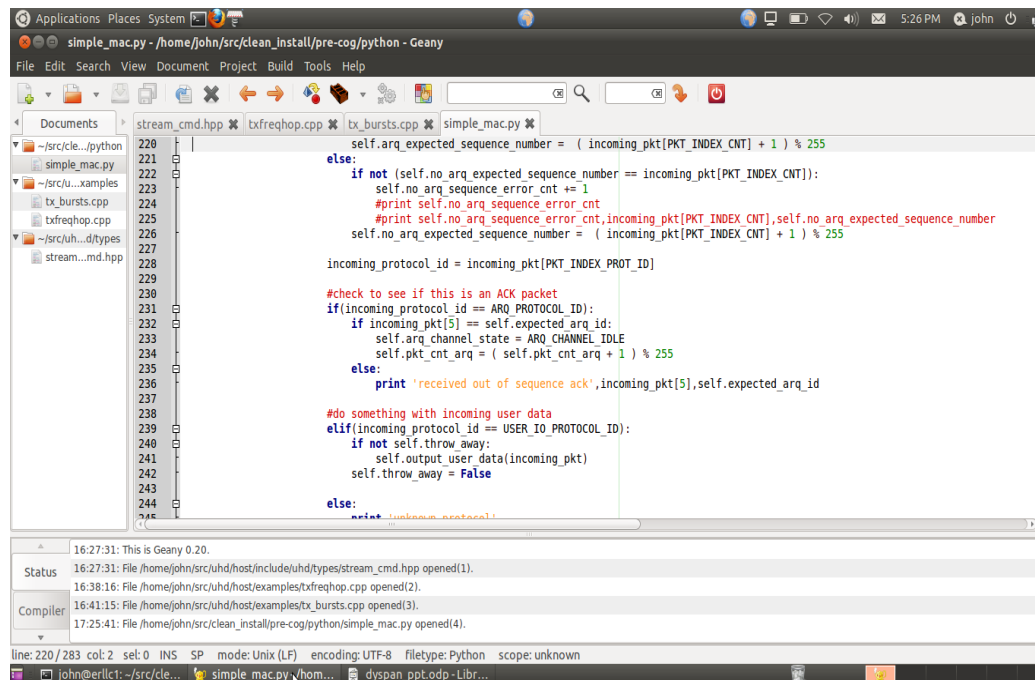

16:27:31: This is Geany 0.20.
Status 16:27:31: File /home/john/src/uhd/host/include/uhd/types/stream_cmd.hpp opened(1).
16:38:16: File /home/john/src/uhd/host/examples/txfreqhop.cpp opened(2).

```

The code in `simple_mac.py` is as follows:

```

220 self.arq_expected_sequence_number = ( incoming_pkt[PKT_INDEX_CNT] + 1 ) % 255
221
222 else:
223     if not (self.no_arq_expected_sequence_number == incoming_pkt[PKT_INDEX_CNT]):
224         self.no_arq_sequence_error_cnt += 1
225         #print self.no_arq_sequence_error_cnt
226         #print self.no_arq_sequence_error_cnt, incoming_pkt[PKT_INDEX_CNT], self.no_arq_expected_sequence_number
227     self.no_arq_expected_sequence_number = ( incoming_pkt[PKT_INDEX_CNT] + 1 ) % 255
228
229 incoming_protocol_id = incoming_pkt[PKT_INDEX_PROT_ID]
230
231 #check to see if this is an ACK packet
232 if(incoming_protocol_id == ARQ_PROTOCOL_ID):
233     if incoming_pkt[5] == self.expected_arq_id:
234         self.arq_channel_state = ARQ_CHANNEL_IDLE
235         self.pkt_cnt_arq = ( self.pkt_cnt_arq + 1 ) % 255
236     else:
237         print 'received out of sequence ack', incoming_pkt[5], self.expected_arq_id
238
239 #do something with incoming user data
240 elif(incoming_protocol_id == USER_IO_PROTOCOL_ID):
241     if not self.throw_away:
242         self.output_user_data(incoming_pkt)
243         self.throw_away = False
244
245 else:
246     print 'unknown protocol'
  
```

Python-Defined MAC Layer

```

220 self.arq_expected_sequence_number = ( incoming_pkt[PKT_INDEX_CNT] + 1 ) % 255
221
222 else:
223     if not (self.no_arq_expected_sequence_number == incoming_pkt[PKT_INDEX_CNT]):
224         self.no_arq_sequence_error_cnt += 1
225         #print self.no_arq_sequence_error_cnt
226         #print self.no_arq_sequence_error_cnt, incoming_pkt[PKT_INDEX_CNT], self.no_arq_expected_sequence_number
227         self.no_arq_expected_sequence_number = ( incoming_pkt[PKT_INDEX_CNT] + 1 ) % 255
228
229 incoming_protocol_id = incoming_pkt[PKT_INDEX_PROT_ID]
230
231 #check to see if this is an ACK packet
232 if(incoming_protocol_id == ARQ_PROTOCOL_ID):
233     if incoming_pkt[5] == self.expected_arq_id:
234         self.arq_channel_state = ARQ_CHANNEL_IDLE
235         self.pkt_cnt_arq = ( self.pkt_cnt_arq + 1 ) % 255
236     else:
237         print 'received out of sequence ack', incoming_pkt[5], self.expected_arq_id
238
239 #do something with incoming user data
240 elif(incoming_protocol_id == USER_IO_PROTOCOL_ID):
241     if not self.throw_away:
242         self.output_user_data(incoming_pkt)
243         self.throw_away = False
244
245 else:
246     print 'unknown protocol!'
  
```

Simple MAC

- Local addr: 0
- Max ARQ attempts: 10
- ARQ timeout: 40m
- Broadcast interval: 2
- Backoff: Linear
- Backoff randomness: 50m
- Node expiry delay: 10
- Expire on ARQ failure: No
- Only send if alive: No

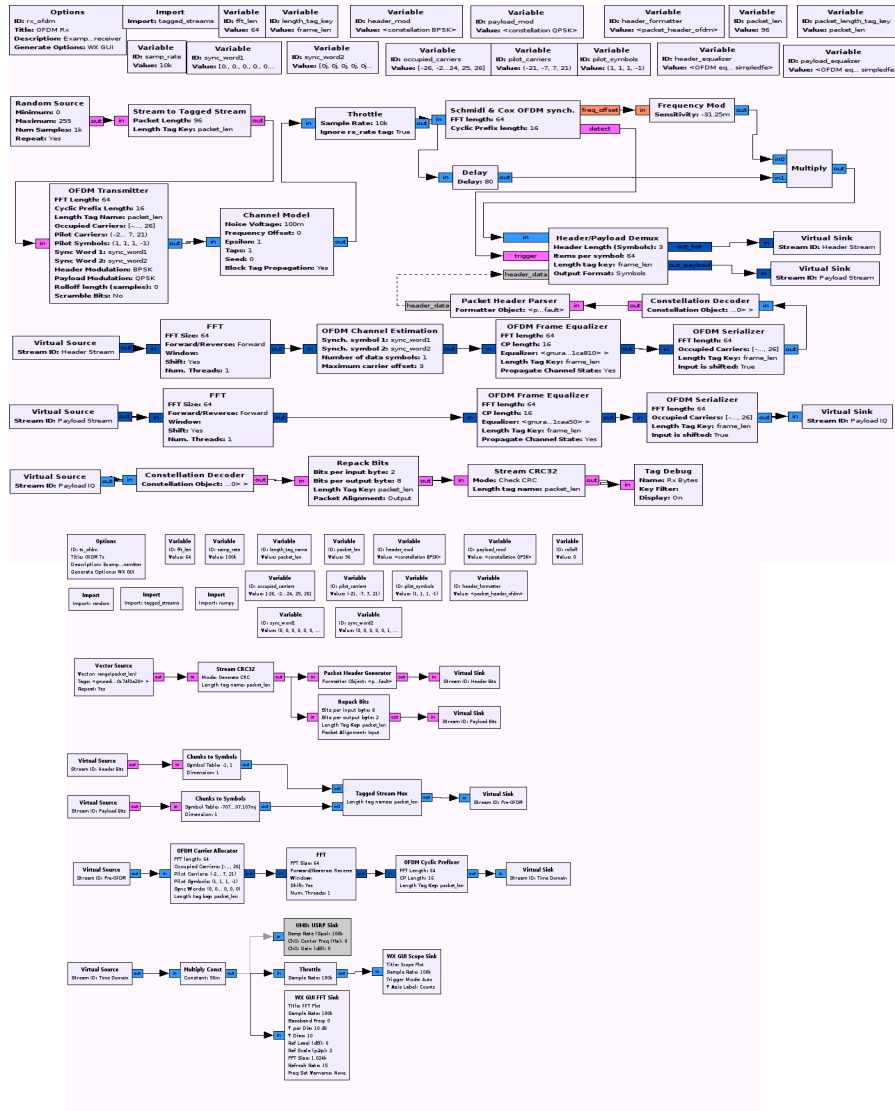

Adding MAC to the Transceiver

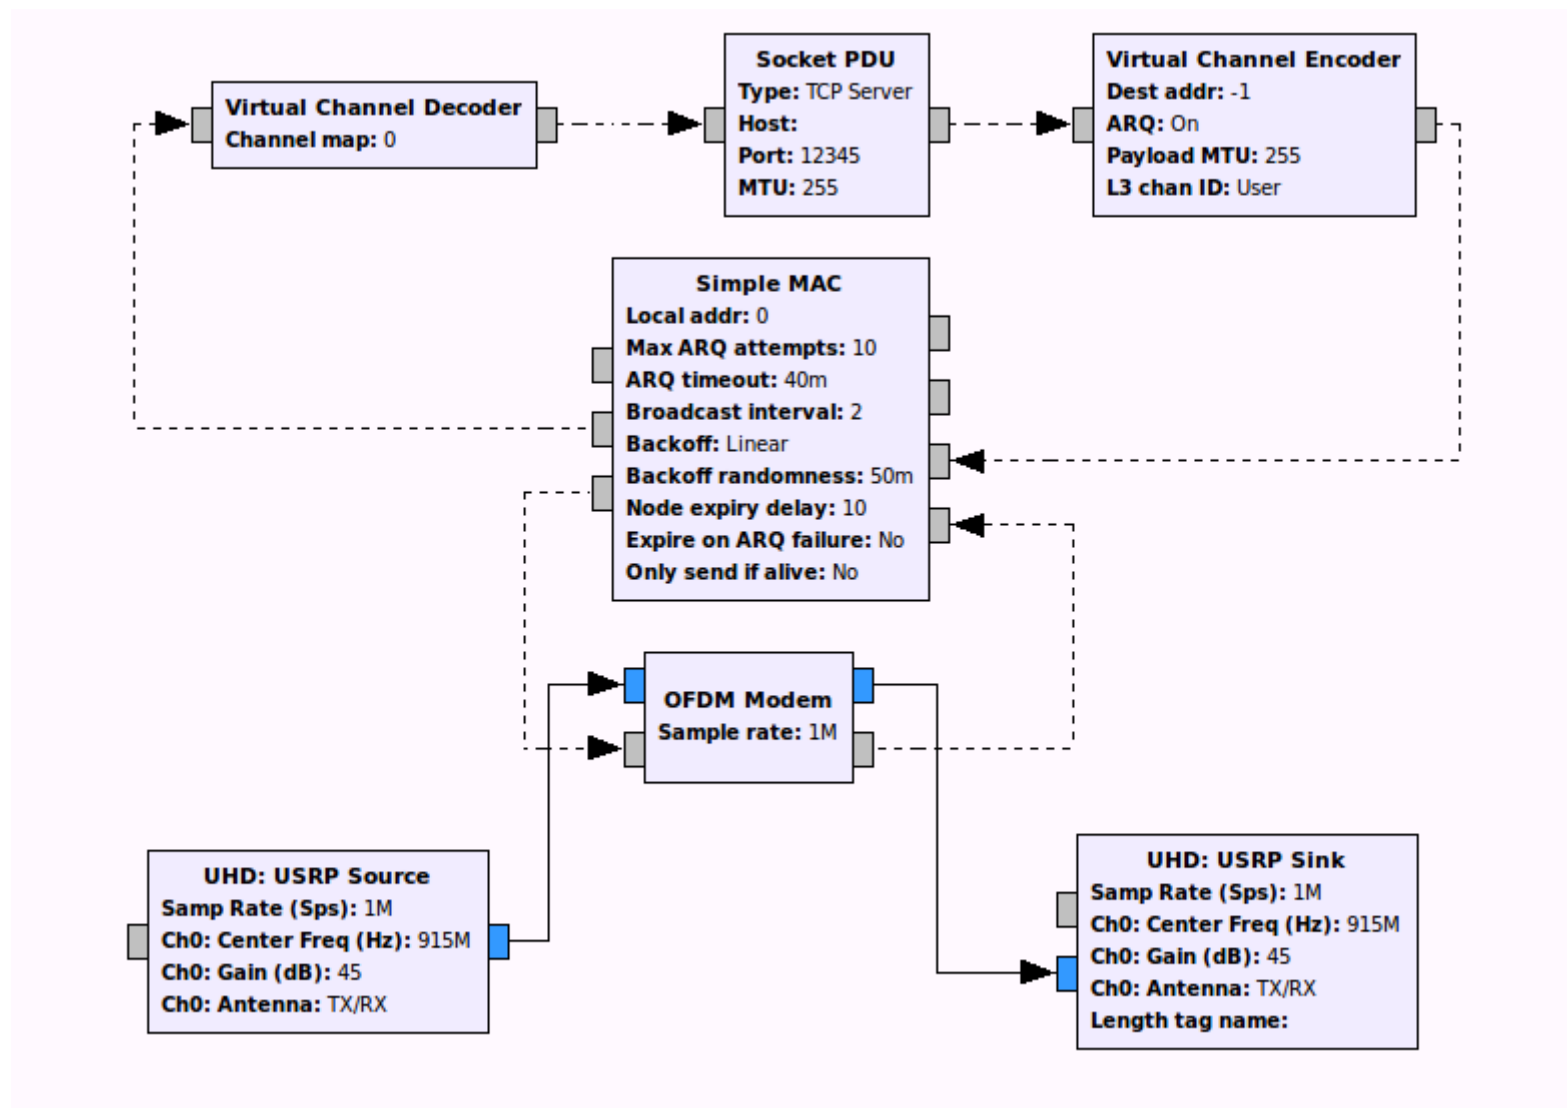

About 3.5 hrs later...

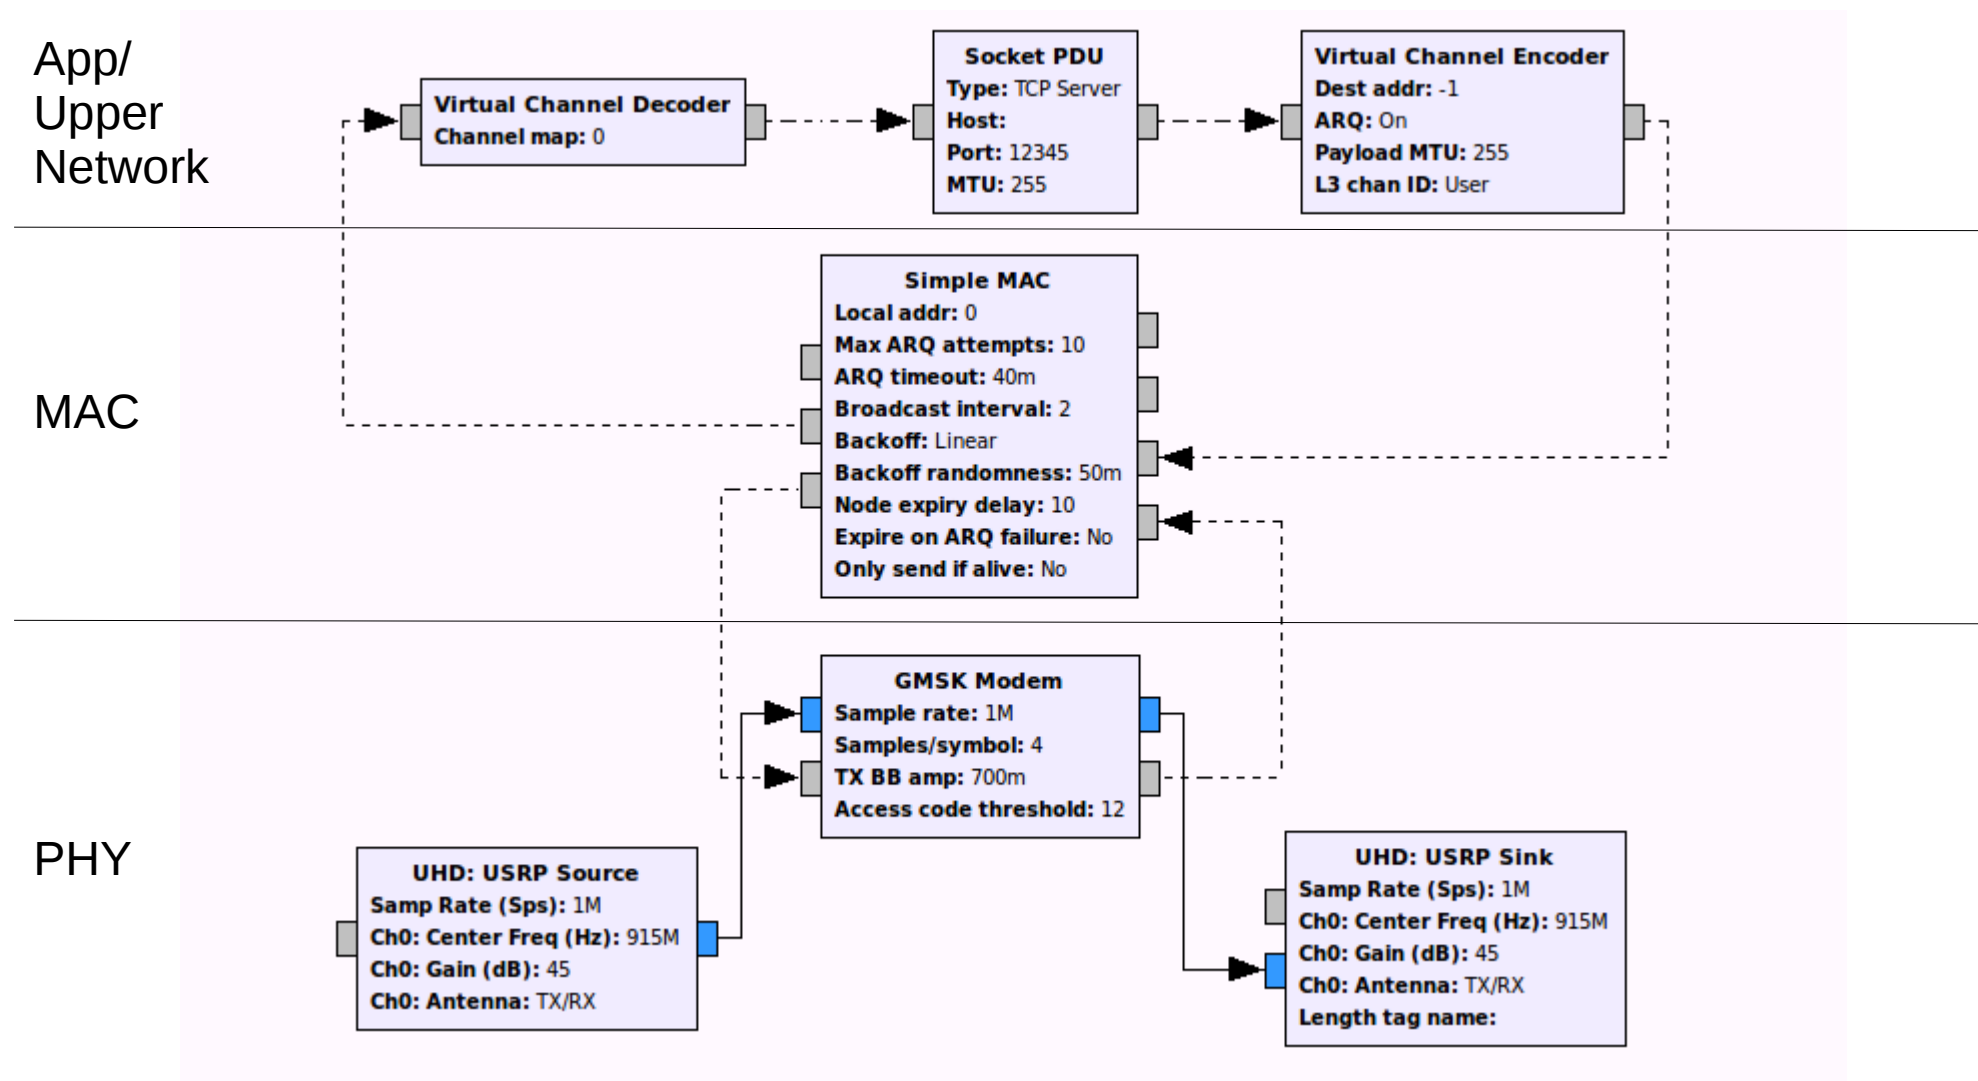

Back to the OFDM...

And then we have an OFDM transceiver...

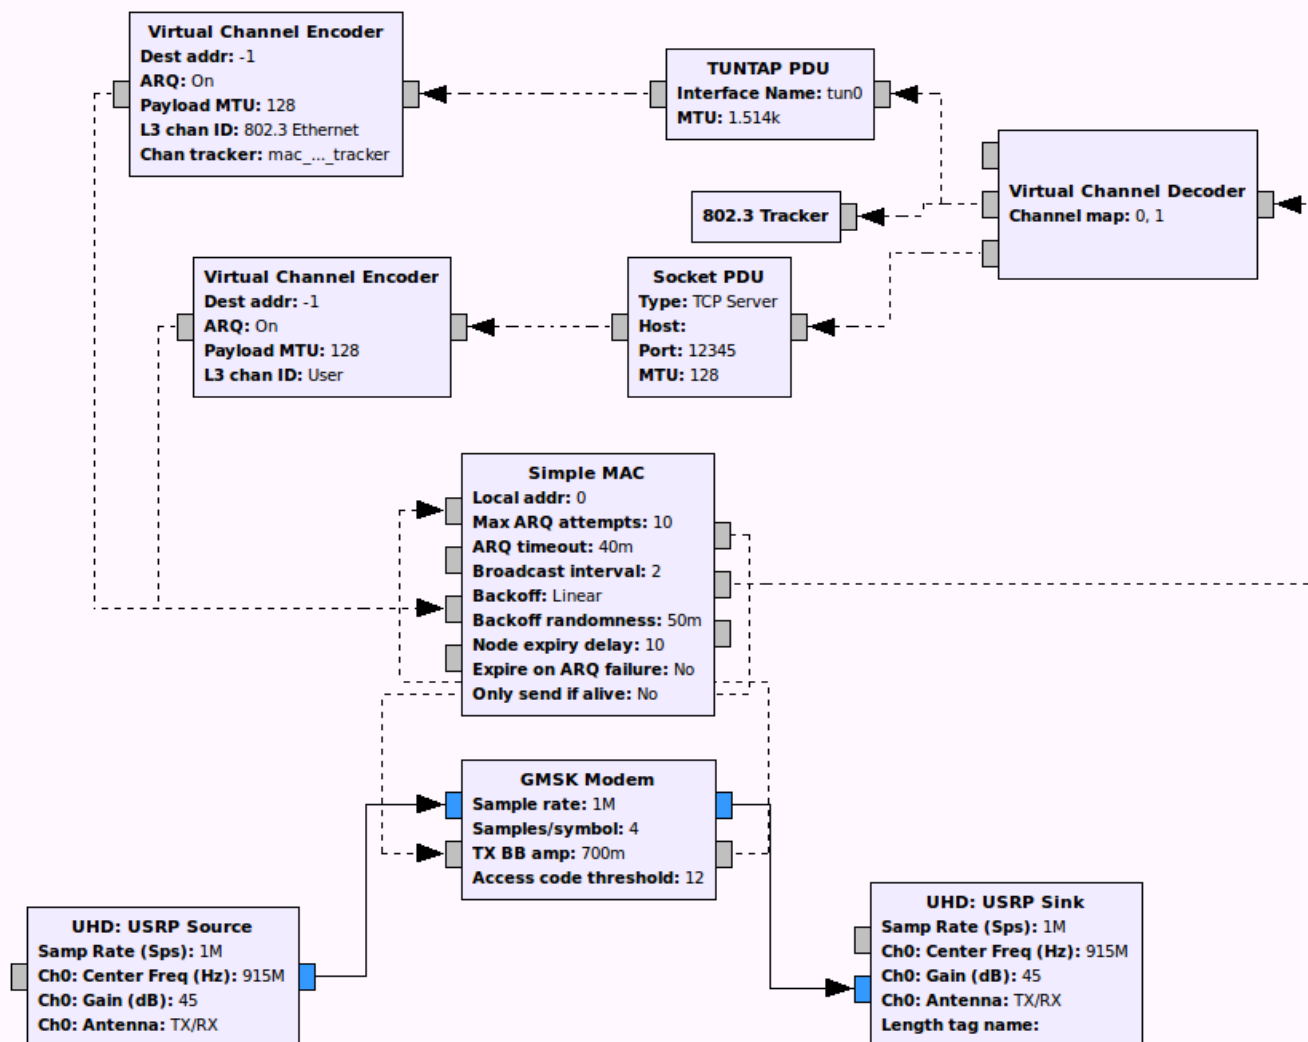

Adding MAC to the Transceiver

But some of us (me) have OCD...

And then Balint kicked my butt in BZFlag...

IP Games over gr-mac

Balint's Tank
Mostly Shooting

My Tank
Mostly Exploding

USRP B200

Release the Rage in:

B200-BZFlag Demo

@ Hackfest on Friday!

Balint Winning (many times)

Other Ways to Interact with a Transceiver

```
#make the flowgraph
tb = simple_trx_mac(rx_antenna=antenna, rx_gain=options.rx_gain, tx_gain=options.tx_gain, &
tb.start()
```

```
while(1):
    if state == INIT:
        #start the FG - disable transmission until next state
        tb.set_ampl(0.0)
        if options.mode == "slave":
            print "I'm a slave, searching for channel."
            index = 0
            last_byte_count = 0
            period = 0.250
            tb.set_beacon_interval = 10.0
            state = SEARCH
        elif options.mode == "master":
            tb.set_beacon_interval = 0.1
            print "I'm a master, setting channel"
            state = MASTER_SET
        else:
            print "Invalid mode '%s' specified. Exiting." % options.mode
            sys.exit()

    elif state == SEARCH:
        if not tb.simple_mac.get_rx_byte_count() > last_byte_count:

            try:
                freq = channels[index]
                print "Searching. Setting Slave to %f MHz." % (freq/1e6)
                tb.set_rx_freq(freq)
                tb.set_tx_freq(freq)
                index = ( index + 1 ) % len(channels)
            except:
                print "Could not set SDR center frequency. Most likely a bad frequency index."
                sys.exit()

        else:
            print "Found downlink, moving to nominal comms state."
            state = NOMINAL
            tb.set_ampl(options.ampl)
            tb.set_tx_gain(options.tx_gain)
            period = 15.0
```

gr-mac Wishlist

PHY	Spread Spectrum		
Channel Access	RSSI-based Channel Sense Implementation	FHSS	TDMA
Networking Layer	QoS management	Self-organizing networks	Good Idea
FEC Integration	Anything from gr-fec	Good Idea	Good Idea
PHY/MODEM	Freq error correction and burst sync for GMSK Demod	Spread spectrum	QAM/PSK integration (test_corr_and_sync)
Utility	Traffic simulator	BSC Simulator	Shared channel simulator for bursty signals
ARQ	Sliding Window	Hybrid ARQ	Good Idea
Awesome-ness	FPGA PHY Integration (ie. RF NoC)	Embedded	Anything on Parallela
Boring but Important	Documentation	Throughput/latency benchmarks	Python → C++

gr-mac Challenge

- You have an RTL-SDR!
- Low-power encoded beacon @ Hackerspace
- Hints:
 - GMSK modem
 - simple_trx.py might be a good place to start
 - Share results/progress with #grcon14 hashtag on twitter
 - Random parameters:
 - Multiple data rates < 125 kbps
 - Hopping across the amateur 33 cm band (KI4MTT)
 - Get help via Tutor Program!
